

Computer Keyboard

History

1867: Christopher Latham Sholes developed the first working keyboard

1868: Sholes officially patented the original keyboard which was known as a typewriter

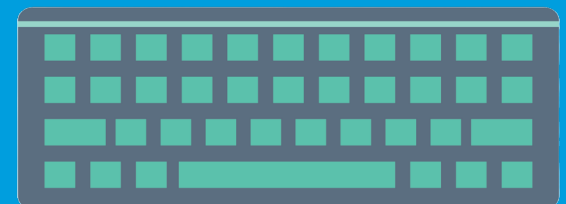

1874: Sholes showed off the QWERTY style of keyboards we see today

1878 Sholes and Densmore patent the QWERTY style keyboard

1970: The Teleprinter style keyboard becomes the main keyboard

Communication Technology System

This fits the Communication Technology Systems because it uses Human to Computer input, where you have a human type on the keyboard where it then inputs into a computer system to produce whatever it is that they are typing. It then holds the information on the computer or paper that it then givesv to the person to show that it went through,

Uses and Impacts

Current uses of the Computer Keyboard today is being able to communicate with people worldwide, keeping ideas in a safe space, using the ability to transfer ideas to others, as well as being able to do fun activities on a Computer.

Some Impacts it has is that we are able to share political opinions throughout the internet, as well as give out culturual ideas to others from wher-ever you are. Besides that you are able to search up advice that you can use for economic or social activities.
